

1 a display-data line which supplies data of the image from an exterior to said
2 display unit;

3 memories which store information for controlling displaying of the data of the
4 image on said display unit, said information being different from said data of the image;

5 an operation circuit unit which controls said display unit to display the data of
6 the image supplied through said display-data line based on the information stored in said
7 memories;

8 a data bus which connects said memories to an exterior of said display device,
9 and supplies the information to said memories from the exterior of said display device; and

10 an address bus which connects said memories to the exterior of said display
11 device, and supplies address signals for selecting one of said memories.

REMARKS

As a preliminary matter, Applicants respectfully submit that the Section 103 rejection of claims 8-11 must be withdrawn. The Examiner has, in Paper Nos. 3, 7, and 10, cited Ramamurthy et al. (U.S. 6,121,949) as the sole basis for rejecting the additional claim features recited in dependent claims 8-11. However, in both Response A, filed February 27, 2001, and in Response B, filed August 15, 2001, Applicant has submitted specific arguments detailing the differences from, and advantages over, Ramamurthy with respect to each and every claim 8-11. The Examiner though, has not answered, or even addressed, any one of
